Duration tells investors the length of time, in years, that it will take a bond’s cash flows to repay the investor the price he or she has paid for the bond. Fixed income securities with higher duration have higher interest rate sensitivity i.e. the changes in price of higher duration bonds are higher as compared to lower duration ones. A zero coupon bond is one which does not pay any interest and all payments are received at maturity. For a zero coupon bond, the duration is same as residual maturity Formula: There is more than one way to calculate duration, but the Macaulay duration is the most common. The formula is: $\text{Macaulay Duration} = \frac{\sum_{t=1}^n \left(\frac{tC}{(1+y)^t} + \frac{nM}{(1+y)^n} \right)}{P}$ where: t = period in which the coupon is received, C = periodic (usually semiannual) coupon payment, y = the periodic yield to maturity or required yield, n = number of periods, M = maturity value (in ₹), P = market price of bond Notes: Duration is quoted in “years.” If a bond has a semi-annual period, we convert duration to years before quoting it (a duration of 8 semi-annual periods is 4 years). Duration is a measure of interest-rate risk. Or, stated differently, duration is a measure of how sensitive the price of a fixed-income instrument is to interest-rate changes. When we say, “The duration of the bond is 4 years,” we mean: “If the interest rate on the bond goes up by 1%, the bond’s price will decline by 4%.”</p>	Instruments	Indicative allocations (% of total assets)		Risk Profile	Minimum	Maximum	Debt, Money Market Instruments/ T- Bills / Repo/CBLO*	0	100	Low to Medium
